Subject: Time use on an average weekday for full-time university and college students.

In the period from year 2014 to 2015 I have been collecting information on how students in the USA spend their time on an average weekday. In this report I would like to show the results of my project.

In general, the results were not unexpected. Sports and leisure have shown to be some wide-spread extracurricular activities among university and college students. Grooming, on the other hand, has not.

Firstly, in comparison to 2014, students in 2015 tend to sleep less. Secondly, practicing educational activities has become a less popular choice, being reduced by 1,0 points. And thirdly, preference to other activities that do not include the main points of the list has been enormously reduced.

Though, the amount of travelling in 2015 has increased to almost twice as much as in 2014. Also, students seem to pursue working as a free-time activity more and more frequently. It has also been shown that in 2015 students do eat and drink ~~more~~ twice as much as in the previous year, which may have unpleasant consequences for some of them.

To make a conclusion, I would say that no critical changes have happened and that the whole situation is quite stable. Although, students may need extra motivation to be educating themselves in their free time and perhaps some changes in their schedule, so they get more sleep.
